WP CONTROL

WordPress Client Management - Condensed Functional Specification & UI Preview

Concept

A lightweight, modular management system integrated into an existing WordPress admin. It consists of two installable plugins: a central Manager and a small Agent installed on each client website.

Two-plugin architecture

PLUGIN	RESPONSIBILITY
WP Control Manager	Client and website directory, health dashboard, update history, manual maintenance records, filters, reporting.
WP Control Agent	Securely collects WordPress/PHP versions, plugins, themes, available updates and supported backup information.

Key screens

Overview: website status, pending updates, backup freshness, last sync, last maintenance date and performer.

Site details: Overview, Updates, Maintenance, Backups, Security, Activity and Notes.

Maintenance log: performed date, performer, work category, description, optional duration and notes; link one record to multiple detected changes.

Automatic + manual update tracking

The Agent sends component snapshots. The Manager detects version changes and records the previous version, new version and detection time. A technician can then attach a maintenance record with their name and notes. A detected version change alone does not prove who performed it.

Core data model

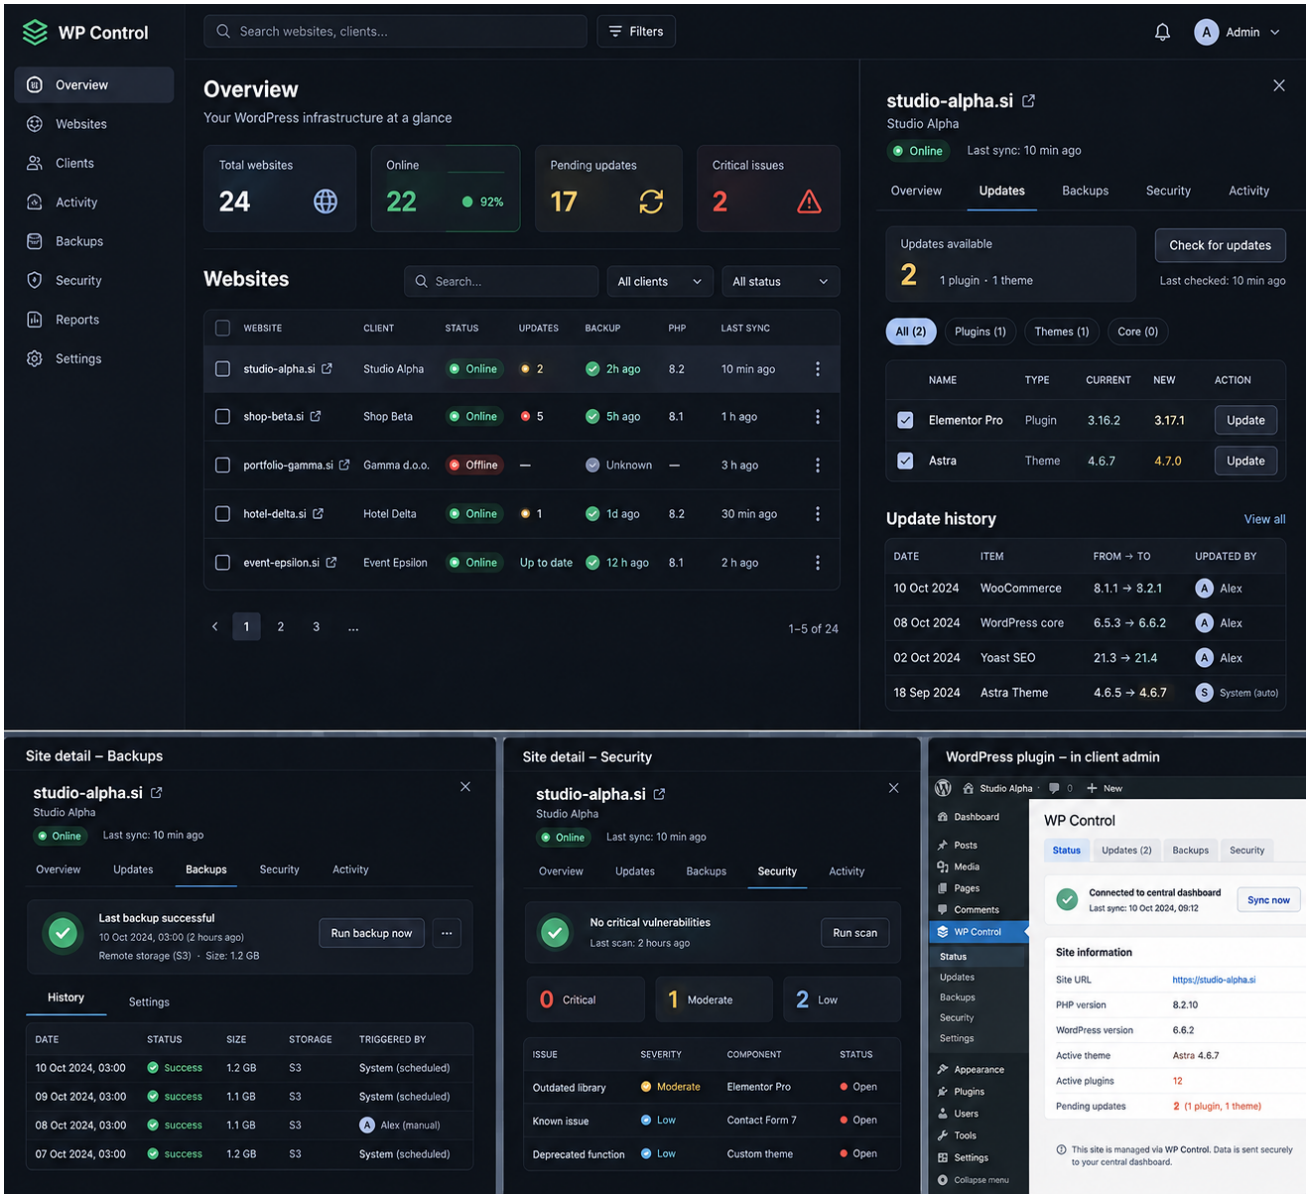

Clients, Sites, Agents, Components, Update Offers, Component Events, Maintenance Logs, Maintenance-Event Links, Site Checks, Backups and Sync Runs. Use dedicated WordPress database tables and versioned REST endpoints.

MVP and safeguards

Start with read-only monitoring, secure Agent pairing, site detail views, change detection, manual maintenance logging and CSV export. Add remote updates, advanced security scanning and notifications later. Use HTTPS, per-site credentials, signed requests, permission checks and audit history.

UI PREVIEW

Illustrative visual direction - dark management dashboard, site details and a WordPress admin plugin view. Sample data only; not a working application.

Design direction: compact sidebar, status-first tables, slide-out site details, and a dedicated maintenance history with the person responsible for each documented task.
